Critical Evaluation and Conclusion

Use this as a speaking guide, not a script to memorise. Keep the meaning, but say it in your own natural voice.

SLIDE 21

What the study actually concludes

The study reaches a balanced conclusion. The coaching improved self-awareness and helped managers understand the emotional complexity of leadership. They became more open about their feelings and personal responsibility. However, the programme did not develop interpersonal effectiveness to the same level. Positive psychology coaching was useful, but personal insight alone was not enough to make someone an effective people leader.

SLIDE 22

Critical evaluation

The study has several strengths. It gives rich descriptions of what participants experienced and openly reports that the programme did not achieve everything it intended. The use of field notes, essays and independent reviewers also strengthened the analysis. Its limitations are equally important: the sample was small, the study covered one organisation, the programme lasted only ten weeks, and the coach was also the researcher.

SLIDE 23

What we would do differently

If we redesigned the study, we would separate the coach and researcher roles. We would include independent interviews and observe behaviour for a longer period. We would also ask colleagues and direct reports whether leadership behaviour actually changed. Finally, we would add practical exercises in listening, feedback and difficult conversations, followed by another assessment several months later.

SLIDE 24

Leadership implication

The main lesson is that coaching should not end with private reflection. Organisations need to connect it with observation, feedback and practice in real workplace situations. Positive psychology remains useful, especially when it allows people to discuss difficult emotions honestly. Our final takeaway is simple: self-awareness may begin leadership development, but other people must be able to experience the change. Thank you.
